Which AWS service or feature requires an internet service provider (ISP) and a colocation facility to be implemented?

- A. AWS VPN
- B. Amazon Connect
- C. AWS Direct Connect **Most Voted**
- D. Internet gateway

Correct Answer: C

Community vote distribution

C (75%)

A (25%)

Comments

dragosky 5 months ago

Selected Answer: C

Correct answer: C. AWS Direct Connect

Explanation:

AWS Direct Connect provides a dedicated, private network link between your on-premises environment and AWS. Implementing it typically involves working with an ISP or network provider and using a colocation facility or a Direct Connect partner location to establish the physical connection.

AWS VPN (A) uses the public internet to create an encrypted tunnel; it does not require a colocation facility.

Amazon Connect (B) is a cloud-based contact center service; no ISP/colo setup is required beyond normal internet access.

Internet gateway (D) is a VPC component that enables internet access for resources in the VPC; it does not require ISP coordination or colocation.

upvoted 2 times

Kiwi28 6 months, 1 week ago

Selected Answer: C

AWS Direct Connect requires working with:

An internet service provider (ISP) or AWS Direct Connect Partner

An AWS Direct Connect location (typically a colocation facility)

AWS Direct Connect provides a dedicated, private network connection from on-premises infrastructure to AWS, which improves bandwidth consistency and reduces latency compared to internet-based connections.

Why the other options are incorrect

A. AWS VPN – Uses encrypted tunnels over the public internet; no colocation facility required.

B. Amazon Connect – A cloud contact center service.

D. Internet gateway – Enables internet access for a VPC; does not require a colocation facility.

✓ Final Answer: C. AWS Direct Connect

upvoted 1 times

SimonR2 8 months, 2 weeks ago

Selected Answer: A

Should this not be a VPN? Direct connect doesnt require an ISP, if youre going to route data over a site to site VPN it requires the internet, therefore an ISP and colocation facility (endpoint).

upvoted 1 times

its_tima 1 year, 9 months ago

"AWS Direct Connect links your internal network to an AWS Direct Connect location over a standard Ethernet fiber-optic cable."

upvoted 1 times

A company wants its Amazon EC2 instances to operate in a highly available environment, even if there is a natural disaster in a particular geographic area.

Which solution achieves this goal?

- A. Use EC2 instances in multiple AWS Regions.
- B. Use EC2 instances in multiple edge locations.
- C. Use EC2 instances in the same Availability Zone but in different AWS Regions.
- D. Use Amazon CloudFront with the EC2 instances configured as the source.

Correct Answer: A

Keyword: Domain Name for the website

Route53:

Amazon Route 53 is a highly available and scalable cloud domain name system (DNS) service. Enables to customize DNS routing policies to reduce latency.

In AWS Route53 is a service to use Domain Name Service and DNS routing policies including health checks of web servers.

Answer: B. Amazon Route 53

upvoted 3 times

A company uses a third-party identity provider (IdP). The company wants to provide its employees with access to AWS accounts and services without requiring another set of login credentials.

Which AWS service will meet this requirement?

- A. AWS Directory Service
- B. Amazon Cognito
- C. AWS IAM Identity Center **Most Voted**
- D. AWS Resource Access Manager (AWS RAM)

Correct Answer: C

Community vote distribution

Comments

jj112233 **Highly Voted** 2 years, 1 month ago

B. Amazon Cognito

Amazon Cognito allows you to add user sign-up, sign-in, and access control to your web and mobile apps quickly and easily. With Cognito, you can integrate with your existing third-party identity provider (IdP) through industry-standard protocols such as OpenID Connect (OIDC) and SAML 2.0.

upvoted 10 times

dragosky **Most Recent** 5 months ago

Selected Answer: C

Correct answer: C. AWS IAM Identity Center

Explanation:

AWS IAM Identity Center (formerly AWS Single Sign-On) enables federated access to AWS accounts and applications using an existing third-party IdP via SAML or OIDC, so employees can sign in with their existing corporate credentials without creating separate AWS logins.

AWS Directory Service (A) integrates with Microsoft Active Directory for directory needs but doesn't itself provide cross-account SSO with third-party IdPs as seamlessly as IAM Identity Center.

Amazon Cognito (B) is primarily for end-user authentication to your applications, not for workforce access to AWS accounts and services.

upvoted 1 times

Kiwi28 6 months, 1 week ago

Selected Answer: C

AWS IAM Identity Center (formerly AWS Single Sign-On) enables single sign-on (SSO) for workforce users by integrating with a third-party identity provider (IdP).

It allows employees to:

Use their existing corporate credentials

Access multiple AWS accounts and AWS services

Avoid managing separate AWS usernames and passwords

Why the other options are incorrect

A. AWS Directory Service – Provides managed directories, but does not directly provide SSO across AWS accounts by itself.

B. Amazon Cognito – Designed for customer-facing application users, not workforce access to AWS accounts.

D. AWS Resource Access Manager (AWS RAM) – Shares AWS resources across accounts, not identities.

✅ Final Answer: C. AWS IAM Identity Center

upvoted 1 times

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. AWS IAM Identity Center - provides federated access, single sign on, and centralized management
upvoted 3 times

Meow7 1 year, 11 months ago

The key is "...WITHOUT requiring another set of login credentials."

please help with discussion on 478~480. Thanks.

upvoted 1 times

RockyRoccoco 1 year, 11 months ago

Selected Answer: A

AWS Directory Service: AWS Directory Service allows you to integrate AWS with your existing Active Directory or other LDAP-based directory services. You can use AWS Directory Service with AWS Single Sign-On (SSO) to enable federated access to AWS accounts and services. This means employees can use their existing corporate credentials (from the third-party IdP) to sign in to AWS without needing separate AWS-specific credentials.

upvoted 1 times

efromdc 2 years ago

Selected Answer: C

The key is "...WITHOUT requiring another set of login credentials."

Therefore the answer is C, IAM.

B, Cognito, would be using an additional set of login credentials.

upvoted 3 times

geocis 2 years ago

Selected Answer: C

I initially answered option (B), Amazon Cognito, but I read too fast. The company uses a third-party IDP and wants to provide its employees access to AWS accounts and services without creating new logins.

This can be accomplished by using IAM.

AWS IAM Identity Center replaced AWS SSO (Single Sign-on).

This service provides a single place to create and manage multiple AWS accounts and business applications. It also creates or connects workforce identities and manages their access centrally. SSO access to AWS accounts and SSO Access to Applications such as M365, Salesforce, and custom SAML 2.0 applications.

A company runs a legacy workload in an on-premises data center. The company wants to migrate the workload to AWS. The company does not want to make any changes to the workload.

Which migration strategy should the company use?

- A. Repurchase
- B. Replatform
- C. Rehost **Most Voted**
- D. Refactor

Correct Answer: C

Community vote distribution

C (100%)

Comments

alokdixit2006 1 year, 3 months ago

Selected Answer: C

Rehosting (lift and shift) is the process of migrating your on-premises application to the cloud without modifying it
upvoted 1 times

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. Rehost - migrating, but not making any changes
upvoted 1 times

Yomijohnson 1 year, 7 months ago

Rehosting, also known as "lift and shift," is the migration strategy where you move an existing workload from on-premises to AWS without making any changes to the application itself. This strategy is the most suitable when the company does not want to modify the workload but needs to move it to the cloud for reasons such as scalability, cost savings, or resource optimization.
upvoted 1 times

Kilobay1 1 year, 10 months ago

Selected Answer: C

Rehosting is the ideal strategy for migrating a legacy workload to AWS when the goal is to maintain the existing application unchanged. This approach allows for a straightforward migration with minimal adjustments.
upvoted 1 times

A company is planning to migrate applications to the AWS Cloud. During a system audit, the company finds that its content management system (CMS) application is incompatible with cloud environments.

Which migration strategies will help the company to migrate the CMS application with the LEAST effort? (Choose two.)

A. Retire

B. Rehost **Most Voted**

C. Repurchase **Most Voted**

D. Replatform

E. Refactor

Correct Answer: BC

Community vote distribution

Comments

geocis **Highly Voted** 2 years ago

Selected Answer: BC

It's not (E) Refactor, requiring significant development effort and increased migration timelines.

I don't think (A) Retire is an option only because the question states which strategies will help the company migrate the CMS application with the LEAST effort. Choosing to Retire will not help them migrate.

This leaves us with Rehost, Repurchase, and Replatform. Based on the following and a process of elimination, my choices would be B and C.

B) Rehost - Benefits: Rapid migration, minimal code changes, reduced risk. May not fully leverage cloud-native features, potential for suboptimal cost and performance.

C) Repurchase - Benefits: Rapid migration, reduced maintenance burden, potential for cost savings. Limited customization, potential for data migration challenges.

D) Replatform - Benefits: Balance of speed and optimization, leverage cloud benefits. Requires careful planning, potential for increased complexity.
upvoted 8 times

damital015 1 year, 10 months ago

It states "planning to migrate applications", it only mentions the CMS specifically to state its incompatible. I think A and C are the only 2 options
upvoted 2 times

JoeTromundo **Highly Voted** 1 year, 9 months ago

Selected Answer: CD

It can't be B: the application is INCOMPATIBLE with cloud environments.

C and D are the least effort option, in this case.

upvoted 5 times

dragosky **Most Recent** 5 months ago

Selected Answer: AC

A. Retire

If the CMS is incompatible and not needed or can be consolidated/eliminated, retiring it avoids migration effort entirely.

C. Repurchase

Replace the existing CMS with a cloud-native SaaS solution (e.g., a managed CMS). This avoids heavy rework and is typically faster than modifying the existing application to run in the cloud.

Notes on the others:

B. Rehost ("lift and shift") is low effort in general, but it won't help if the application is incompatible with cloud environments.

upvoted 2 times

Sesh_14 1 year ago

Selected Answer: BD

B. Rehost (Lift and Shift)

Least effort strategy to migrate the app as-is

No code changes; just move the app to EC2 or similar compute on AWS

Ideal for legacy or cloud-incompatible application

D. Replatform

Requires some minor adjustments, like changing the operating system or database, but keeps the core architecture unchanged

Still considered low effort compared to refactoring or repurchasing

A good choice if slight tweaks are needed to make the CMS cloud-compatible

A. Retire

Removes the app — does not migrate it

Not a valid answer since the question is about migration, not decommissioning

C. Repurchase

Replacing the CMS with a SaaS solution involves medium to high effort due to data migration, integration, and retraining

E. Refactor

Involves rebuilding or re-architecting the app

High effort — not suitable when minimal changes are desired

upvoted 1 times

Malik88 1 year ago

Selected Answer: BD

true for me

upvoted 1 times

84501e1 1 year, 1 month ago

Selected Answer: AC

content management system (CMS) application is incompatible with cloud environments → (A) Retire

→ (C) Repurchase

Replatform involves some code/config changes

upvoted 1 times

7e6e895 1 year, 1 month ago

Selected Answer: AC

the traditional "lift and shift" (Rehost) or even "lift, tinker, and shift" (Replatform) strategies become difficult or impossible without significant re-engineering. Re-architecting (Refactor) requires the most effort.

upvoted 2 times

femzy 1 year, 4 months ago

Selected Answer: BD

The two migration strategies that will help the company migrate the CMS application with the LEAST effort are:

B. Rehost

D. Replatform

Explanation:

Rehost (Lift-and-Shift):

This strategy involves moving the application to the cloud with minimal or no changes.

Replatform (Lift-Tinker-and-Shift):

This strategy involves making minor optimizations to the application to make it compatible with the cloud environment.

Why not the other options?

A. Retire: This means decommissioning the application, which is not applicable here since the company wants to migrate the CMS.

C. Repurchase: This involves switching to a different product (e.g., a SaaS CMS). While it may reduce effort in some cases, it is not necessarily the least effort if the company wants to retain its existing CMS.

E. Refactor: This involves re-architecting the application to be cloud-native, which requires significant effort and is not the least effort option.

upvoted 2 times

Nikmah 1 year, 4 months ago

Selected Answer: BC

Repurchase "drop and shop"

- Moving to a different product while moving to the Cloud

- Often you move to a SaaS platform

- Expensive in the short term, but quick to deploy

- Example: CRM to Salesforce.com, HR to Workday, CMS to Drupal

upvoted 2 times

Matthew25187 1 year, 4 months ago

Selected Answer: CD

By a process of elimination...

A) is out, because the 2nd paragraph makes it clear the company wants to continue to use a CMS application in a cloud environment, and
B) is out, because the audit determined that the existing application is "... incompatible with cloud environments," and
E) is out, because it doesn't meet the "LEAST effort" requirement.

That leaves (C) and (D).

upvoted 4 times

MeLikeChoco 1 year, 6 months ago

Selected Answer: AE

It all depends on if the CMS is in-house or 3rd party and if they want to keep it in-house or 3rd party. Either way, I believe retiring the CMS is a given
But the other choice, not so much.

upvoted 1 times

FMORADELL 1 year, 10 months ago

Selected Answer: AC

A. Retire: If the application is outdated or not necessary for future operations, retiring it can be the easiest and most cost-effective strategy.

C. Repurchase: This strategy is also known as "drop and shop," where you replace your existing application with a cloud-based solution. It's often easier than modifying or rehosting an incompatible application.

upvoted 1 times

veljkosbbb 1 year, 9 months ago

it says "to migrate CMS" - how can it be "A" then?

upvoted 3 times

VerRi 1 year, 10 months ago

CTao 2 years, 1 month ago

Selected Answer: AB

I think it should be A and B

upvoted 1 times

b0nb0n101 2 years, 1 month ago

A. Retire C. Repurchase

Retire: If the CMS application is not compatible and not necessary for business operations, the company could choose to retire it. This would involve decommissioning the application and not replacing it.

Repurchase: This strategy, also known as "drop and shop", involves moving to a different product. The company could choose to replace the incompatible CMS with a cloud-compatible CMS. This could be a SaaS solution or a CMS designed to run in the cloud. This strategy typically requires less effort than rehosting, replatforming, or refactoring, as it involves setting up a new system rather than modifying the existing one.

alokdixit2006 1 year, 3 months ago

Selected Answer: A

Amazon Elastic Container Service (Amazon ECS) is a fully managed container orchestration service that helps you easily deploy, manage, and scale containerized applications

upvoted 1 times

Which AWS tool or feature acts as a VPC firewall at the subnet level?

- A. Security group
- B. Network ACL **Most Voted**
- C. Traffic Mirroring
- D. Internet gateway

Correct Answer: B

Community vote distribution

B (100%)

Comments

Nikmah 1 year, 4 months ago

Selected Answer: B

NACL (Network ACL)

- A firewall which controls traffic from and to subnet
 - Can have ALLOW and DENY rules
 - Are attached at the Subnet level
 - Rules only include IP addresses
- upvoted 2 times

ShaiTay 1 year, 7 months ago

Selected Answer: B

B. Network ACL - "subnet" is key here. Network Access Control Lists "ACLs" are stateless and operate at the subnet level. They evaluate both incoming and outgoing traffic.

upvoted 3 times

A company runs an application on AWS that performs batch jobs. The application is fault-tolerant and can handle interruptions. The company wants to optimize the cost to run the application.

Which AWS offering will meet these requirements?

- A. Amazon Macie
- B. Amazon Neptune
- C. Amazon EC2 Spot Instances
- D. Amazon EC2 On-Demand Instances

Correct Answer: C

Community vote distribution

C (100%)

Comments

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. Amazon EC2 Spot Instances - spot instances are the best for getting the most bang for your buck if your applications are fault tolerant and can handle interruptions.

upvoted 1 times

Which AWS service can be used to send alerts when a specific Amazon CloudWatch alarm is invoked?

- A. AWS CloudTrail
- B. Amazon Simple Notification Service (Amazon SNS)
- C. Amazon Simple Queue Service (Amazon SQS)
- D. Amazon EventBridge

Correct Answer: B

Community vote distribution

B (100%)

Comments

Nikmah 1 year, 4 months ago

Selected Answer: B

CloudWatch:

- Metrics: monitor the performance of AWS services and billing metrics
- Alarms: automate notification, perform EC2 action, notify to SNS based on metric
- Logs: collect log files from EC2 instances, servers, Lambda functions...
- Events (or EventBridge): react to events in AWS, or trigger a rule on a schedule

upvoted 2 times

ShaiTay 1 year, 7 months ago

Selected Answer: B

B. Amazon Simple Notification Service (Amazon SNS) - allows you to send notifications, emails, and alerts to various endpoints. You can configure the triggered CloudWatch alarm to send a notification to the SNS topic, which then forwards the alert to the relevant recipients.

upvoted 2 times

A cloud practitioner wants to use a highly available and scalable DNS service for its AWS workload.

Which AWS service will meet this requirement?

- A. Amazon Route 53
- B. Amazon Lightsail
- C. AWS Amplify Hosting

D is correct.

please help with discussion on 500 503 ~ 511. Thanks.
upvoted 1 times

ahadh7621 2 years ago

Selected Answer: D

The answer is D, Replatform.

<https://docs.aws.amazon.com/prescriptive-guidance/latest/large-migration-guide/migration-strategies.html>

This strategy is also known as lift, tinker, and shift or lift and reshape. Using this migration strategy, you move the application to the cloud, and you introduce some level of optimization in order to operate the application efficiently, to reduce costs, or to take advantage of cloud capabilities. For example, you might replatform a Microsoft SQL Server database to Amazon RDS for SQL Server.

Using this strategy, you might make a few or many changes to the application, depending on your business goals and your target platform.

The following are common use cases for the replatform migration strategy:

You want to save time and reduce cost by moving to a fully managed service or serverless service in the AWS Cloud.

upvoted 2 times

red_panda 2 years, 1 month ago

Replatform because we are going to from self managed db to fully managed db by aws so it's not sufficient rehost.

upvoted 2 times

Zerro 2 years, 1 month ago

Why not A, rehost? Is it because Rehost is more used for applications and Replatform is used for databases?

upvoted 1 times

ShaiTay 1 year, 7 months ago

In this case, there will be adjustments made due to moving from the database workloads from a self-managed server to an AWS managed service. So that makes it replatforming instead of rehosting. If you rehost, it's just a "lift and shift" without any changes being made.

upvoted 1 times

A company is planning to migrate a monolithic application to AWS. The company wants to modernize the application by splitting it into microservices. The company will deploy the microservices on AWS.

Which migration strategy should the company use?

- A. Rehost
- B. Repurchase
- C. Replatform
- D. Refactor

Which benefit of the AWS Cloud helps companies achieve lower usage costs because of the aggregate usage of all AWS users?

- A. No need to guess capacity
- B. Ability to go global in minutes
- C. Economies of scale
- D. Increased speed and agility

Correct Answer: C

Community vote distribution

C (100%)

Comments

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. Economies of scale

upvoted 2 times

Yomijohnson 1 year, 7 months ago

Economies of scale is a key benefit of the AWS Cloud that allows companies to achieve lower costs due to the vast aggregate usage across all AWS customers. AWS can buy and operate infrastructure at a massive scale, which reduces per-unit costs and allows AWS to pass these savings on to customers. This leads to lower prices for cloud services compared to what individual companies might pay for their own infrastructure.

upvoted 2 times

Which task is the responsibility of the customer, according to the AWS shared responsibility model?

- A. Patch the Amazon DynamoDB operating system.
- B. Secure Amazon CloudFront edge locations by allowing physical access according to the principle of least privilege.

A company's application is running on Amazon EC2 instances. The company is planning a partial migration to a serverless architecture in the next year and wants to pay for resources up front.

Which AWS purchasing option will optimize the company's costs?

- A. Convertible Reserved Instances
- B. Spot Instances
- C. EC2 Instance Savings Plans
- D. Compute Savings Plan **Most Voted**

Correct Answer: D

Community vote distribution

Comments

Supercell **Highly Voted** 2 years, 1 month ago

Selected Answer: D

For a company that is planning a partial migration to a serverless architecture in the next year and wants to pay for resources up front to optimize costs, the best AWS purchasing option is:

D. Compute Savings Plan

The other options are less suitable for this scenario:

A. Convertible Reserved Instances are a billing discount applied to specific EC2 instances and do not provide flexibility for serverless workloads.

B. Spot Instances are suitable for fault-tolerant and flexible workloads but do not offer the ability to pay upfront for a commitment period.

C. EC2 Instance Savings Plans provide discounts on EC2 instances only and do not extend to serverless services like Lambda or Fargate.

By choosing a Compute Savings Plan and paying upfront, the company can optimize costs for their current EC2 usage and seamlessly transition to serverless services as their migration progresses, without losing the committed savings. This flexibility aligns well with their planned partial migration to a serverless architecture.

upvoted 9 times

Yak_Yeti 1 year, 6 months ago

Yes, you can use AWS Compute Savings Plans for serverless services. Compute Savings Plans offer flexible pricing and apply to various AWS compute services, including AWS Lambda and AWS Fargate¹². This means you can benefit from cost savings on your serverless workloads by committing to a consistent amount of usage over a 1- or 3-year term¹.

Would you like more details on how to set up a Compute Savings Plan or how it works with serverless services?

Source: Conversation with Copilot, 12/13/2024

CharmaineBowman 1 year, 6 months ago

Selected Answer: A

Convertible Reserved Instances (RIs) allow customers to purchase EC2 capacity at a discounted rate compared to On-Demand pricing while providing the flexibility to change instance families, operating systems, or tenancies during the term of the reservation.

This flexibility makes it ideal for a company that plans to migrate partially to serverless architecture, as it can adjust its RIs to match changing requirements over time.

The upfront payment option can further optimize costs.

Compute Savings Plans provide discounts on compute services, offering the flexibility to switch between EC2, AWS Lambda, and Fargate. However, they are better suited for fully serverless or containerized migrations rather than for managing upfront costs or EC2-focused workloads in a transitional phase.

JoeTromundo 1 year, 9 months ago

Selected Answer: D

SERVERLESS = Compute Saving Plans

upvoted 2 times

chalaka 1 year, 10 months ago

Selected Answer: D

D. Compute Savings Plans : provide the most flexibility because they apply to a wide range of compute usage across Amazon EC2, AWS Lambda, and AWS Fargate. This is especially beneficial for a company transitioning to a serverless architecture, as it allows them to benefit from cost savings across different AWS services, not just EC2. It also allows the company to commit to a consistent amount of usage (measured in dollars per hour) for a one- or three-year term, optimizing their costs.

upvoted 1 times

Bajogi 1 year, 11 months ago

Selected Answer: D

D. Compute Savings Plan

Compute Savings Plans offer discounts on a variety of AWS compute services, including:

Amazon EC2

AWS Fargate

AWS Lambda

Amazon ECS

This makes them a flexible option for companies transitioning to a serverless architecture while still optimizing costs.

upvoted 1 times

f964633 1 year, 11 months ago

Selected Answer: A

The Convertible Reserved Instances option is the best choice because it allows the company to pay for resources up front, while also providing the flexibility to adjust their Reserved Instance purchases as they migrate to a serverless architecture. This flexibility is crucial as the company plans a partial migration, and Convertible Reserved Instances can help optimize their costs during this transition period.

upvoted 2 times

ahadh7621 2 years ago

Selected Answer: C

C is correct and not D because its only a PARTIAL migration to serverless architecture

upvoted 3 times

A retail company is building a new mobile app. The company is evaluating whether to build the app at an on-premises data center or in the AWS Cloud.

Which of the following are benefits of building this app in the AWS Cloud? (Choose two.)

- A. A large, upfront capital expense and low variable expenses
- B. Increased speed for trying out new projects **Most Voted**
- C. Complete control over the physical security of the infrastructure
- D. Flexibility to scale up in minutes as the application becomes popular **Most Voted**
- E. Ability to pick the specific data centers that will host the application servers

A company must archive its documents by using a write-once, read-many (WORM) model to meet legal and compliance obligations.

Which feature of Amazon S3 can the company use to meet this requirement?

- A. S3 Versioning
- B. S3 bucket policy
- C. S3 Glacier Vault Lock **Most Voted**
- D. S3 multi-factor authentication (MFA) delete

Correct Answer: C

Community vote distribution

C (100%)

Comments

alokdixit2006 1 year, 3 months ago

Selected Answer: C

S3 Glacier Vault Lock allows you to enforce compliance controls on your archived data in Glacier, ensuring data is stored in a "write once, read many" (WORM) manner, meaning it cannot be modified or deleted within a predefined period

upvoted 1 times

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. S3 Glacier Vault Lock

upvoted 1 times

Kilobay1 1 year, 9 months ago

Selected Answer: C

S3 Glacier Vault Lock provides the ability to lock your Glacier vaults to enforce WORM protection. Once a vault is locked with a retention policy, data cannot be modified or deleted for the specified retention period, ensuring compliance with regulatory requirements for write-once, read-many storage. This feature is specifically designed to meet compliance and regulatory requirements for immutable data storage.

upvoted 2 times

Supercell 2 years, 1 month ago

Selected Answer: C

By using S3 Glacier Vault Lock, the company can ensure that its archived documents are stored in a write-once, read-many (WORM) model, meeting legal and compliance obligations that require data immutability and retention for a specified period or indefinitely.

upvoted 3 times

Karpovsky2222 2 years, 1 month ago

The right answer is S3 bucket policy

upvoted 2 times

A company has batch workloads that need to run for short periods of time on Amazon EC2. The workloads can handle interruptions and can start again from where they ended.

upvoted 1 times

Marley 1 year, 11 months ago

Selected Answer: B

B. Global footprint

AWS's global footprint includes multiple regions and availability zones, allowing companies to deploy their applications in specific geographic areas to meet regulatory and compliance requirements.

upvoted 1 times

e59311f 1 year, 11 months ago

Selected Answer: C

To meet regulatory requirements related to data sovereignty and geographic location, the company should focus on Availability within the AWS global infrastructure¹. AWS Regions provide physical locations around the world, each containing multiple Availability Zones (AZs). These AZs are fully isolated partitions of infrastructure, allowing you to deploy applications across different AZs in the same region. By choosing the appropriate region, the company can ensure compliance with data residency laws and regulations specific to their geographic area²³

upvoted 1 times

geocis 2 years ago

Selected Answer: B

B. Global footprint - Expanding infrastructure that spans across multiple geographic locations worldwide.

Which AWS solution gives companies the ability to use protocols such as NFS to store and retrieve objects in Amazon S3?

- A. Amazon FSx for Lustre
- B. AWS Storage Gateway volume gateway
- C. AWS Storage Gateway file gateway **Most Voted**
- D. Amazon Elastic File System (Amazon EFS)

Correct Answer: C

Community vote distribution

Comments

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. AWS Storage Gateway file gateway
upvoted 1 times

veljkosbbb 1 year, 9 months ago

Selected Answer: C

While Amazon FSx for Lustre supports NFS and can integrate with Amazon S3 for high-performance workloads (such as caching data from S3), it is primarily intended for use cases requiring high-performance computing (HPC) and parallel data processing. Its purpose is to optimize compute-heavy tasks by providing a fast file system that can process large-scale data, not to serve as a storage gateway solution for seamlessly storing and retrieving data from S3 via NFS.

The correct answer was C. AWS Storage Gateway file gateway, because AWS Storage Gateway file gateway is specifically designed to allow companies to use NFS (or SMB) protocols to store and retrieve data directly in S3. It acts as a bridge between on-premises environments and Amazon S3, enabling easy integration for businesses that want to store their files as objects in S3.

upvoted 2 times

Kilobay1 1 year, 9 months ago

Selected Answer: A

Amazon FSx for Lustre is a managed file system that provides a high-performance file system optimized for compute-intensive workloads. It supports the Network File System (NFS) protocol and can be linked to Amazon S3. When you create an Amazon FSx for Lustre file system, you can link it to an S3 bucket, enabling you to access objects in S3 using the NFS protocol.

AWS Storage Gateway file gateway might seem like a good candidate due to its support for NFS, but it's important to note that Amazon FSx for Lustre provides a more integrated and performant solution for linking file systems with S3, particularly for use cases requiring high-performance compute.

upvoted 1 times

Selected Answer: A

Amazon Rekognition is a cloud-based image and video analysis service that makes it easy to add advanced computer vision capabilities to your applications. The service is powered by proven deep learning technology and it requires no machine learning expertise to use. Amazon Rekognition includes a simple, easy-to-use API that can quickly analyze any image or video file that's stored in Amazon S3.

You can add features that detect objects, text, unsafe content, analyze images/videos, and compare faces to your application using Rekognition's APIs. With Amazon Rekognition's face recognition APIs, you can detect, analyze, and compare faces for a wide variety of use cases, including user verification, cataloging, people counting, and public safety.

Which advantage of cloud computing allows users to scale resources up and down based on the amount of load that an application supports?

- A. Go global in minutes
- B. Stop guessing capacity
- C. Benefit from massive economies of scale
- D. Trade fixed expense for variable expense

Correct Answer: B

Community vote distribution

B (100%)

Comments

Yak_Yeti 1 year, 6 months ago

Selected Answer: B

The phrase "Stop guessing capacity" is often used in the context of cloud computing. It highlights one of the key benefits of cloud services: the ability to scale resources up or down based on actual demand, rather than having to predict and invest in infrastructure capacity ahead of time. This approach helps avoid the costs associated with over-provisioning (buying more capacity than needed) or under-provisioning (not having enough capacity to meet demand).

upvoted 2 times

ShaiTay 1 year, 7 months ago

Selected Answer: B

B. Stop guessing capacity

A company uses Amazon Aurora as its database service. The company wants to encrypt its databases and database backups.

Which party manages the encryption of the database clusters and database snapshots, according to the AWS shared responsibility model?

- A. AWS
- B. The company **Most Voted**
- C. AWS Marketplace partners
- D. Third-party partners

Correct Answer: B

Community vote distribution

B (71%) A (29%)

Comments

Kiwi28 6 months, 1 week ago

Selected Answer: A

Amazon Aurora is a fully managed database service.

According to the AWS shared responsibility model, AWS is responsible for managing the encryption of:

Database clusters
Automated backups
Database snapshots

This includes the encryption mechanisms and infrastructure (such as storage-level encryption using AWS-managed services).

What the company is responsible for:

Choosing whether encryption is enabled
Managing access controls and permissions
Managing encryption keys (if using customer-managed keys in AWS KMS)

✓ Under the AWS shared responsibility model, AWS manages the encryption of Amazon Aurora database clusters and snapshots.
upvoted 1 times

1507a4f 10 months, 2 weeks ago

Selected Answer: A

AWS is responsible for "security of the cloud" – meaning they manage the infrastructure, including the encryption mechanisms that protect managed services like Amazon Aurora, RDS snapshots, and backups.

The company (customer) is responsible for "security in the cloud" – such as managing database access, IAM policies, and choosing whether or not to enable encryption.

Selected Answer: B

B. AWS Direct Connect - establishes a dedicated, private connection between your on-premises data center or colocation facility and AWS.
upvoted 2 times

Tithink 1 year, 9 months ago

Selected Answer: B

AWS Direct Connect establishes a dedicated network connection from your premises to AWS, which can reduce network costs, increase bandwidth throughput, and provide a more consistent network experience compared to internet-based connections¹. Amazon CloudFront is a content delivery network (CDN) service that speeds up the distribution of your static and dynamic web content, such as .html, .css, .js, and image files, to your users. While it improves the delivery speed and performance of your content, it does not provide a dedicated network connection or address the need for consistent bandwidth throughput and network experience
upvoted 1 times

PT08 1 year, 9 months ago

Selected Answer: B

AWS Direct Connect (B): This service allows you to establish a dedicated network connection from your on-premises data center to AWS. Direct Connect provides a private, high-bandwidth connection that bypasses the public internet, resulting in more consistent network performance and lower latency. This is ideal for applications requiring stable and high-throughput network connections.
upvoted 1 times

Naantje 1 year, 11 months ago

B is correct answer:
By setting up private connectivity over AWS Direct Connect, you could reduce network costs, increase bandwidth throughput, and provide a more consistent network experience than with Internet-based connections.

A company needs to use AWS technology to deploy a static website.

Which solution meets this requirement with the LEAST amount of operational overhead?

- A. Deploy the website on Amazon EC2.
- B. Host the website on AWS Elastic Beanstalk.
- C. Deploy the website with Amazon Lightsail.
- D. Host the website on Amazon S3.

Correct Answer: D

Community vote distribution

D (100%)

Comments

Based_Engineer 12 months ago

Selected Answer: D

STATIC website being the key word. It doesn't change, and it will have a public URL to access it. S3 can do this no problem with minimal overhead.
upvoted 1 times

Ty13 1 year, 3 months ago

Selected Answer: D

This is a tricky question because Amazon has made improvements to Lightsail over the past few years that make it good for static content as well. However, S3 still has the lowest overhead compared to Lightsail.
upvoted 2 times

ShaiTay 1 year, 7 months ago

Selected Answer: D

D. Host the website on Amazon S3.
upvoted 1 times

Yomijohnson 1 year, 7 months ago

Amazon S3 (Simple Storage Service) is ideal for hosting static websites with minimal operational overhead. It allows you to store and serve static content (like HTML, CSS, and JavaScript files) directly from S3 buckets without needing to manage any servers or complex infrastructure. Additionally Amazon S3 is highly scalable, cost-effective, and requires very little maintenance.
upvoted 2 times

its_tima 1 year, 8 months ago

I found this question to be a bit tricky since Amazon Lightsail is similar in terms of building websites, web applications and deals with static IP addresses. But then I found this: <https://docs.aws.amazon.com/AmazonS3/latest/userguide/WebsiteHosting.html>
"You can use Amazon S3 to host a static website. On a static website, individual webpages include static content. They might also contain client-side scripts."
upvoted 3 times

Which recommendation can AWS Cost Explorer provide to help reduce cost?

- A. Use a specific database engine.
- B. Change the programming language for an application.
- C. Deploy a specific operating system.
- D. Terminate an idle instance.

Correct Answer: D

Community vote distribution

D (100%)

Comments

ShaiTay 1 year, 7 months ago

Selected Answer: D

D. Terminate an idle instance.

upvoted 1 times

its_tima 1 year, 9 months ago

D. Stop guessing your capacity needs: If you make a poor capacity decision when deploying a workload, you might end up sitting on expensive idle resources or dealing with the performance implications of limited capacity. With cloud computing, these problems can go away. You can use as much or as little capacity as you need, and scale in and out automatically.

Which Amazon EC2 Reserved Instances term commitment will give users the MOST cost savings?

- A. 1 year
- B. 2 years
- C. 3 years
- D. 5 years

Correct Answer: C

Community vote distribution

C (100%)

Comments

ShaiTay 1 year, 7 months ago

Selected Answer: C

C. 3 years

upvoted 1 times

Yomijohnson 1 year, 7 months ago

Amazon EC2 Reserved Instances offer cost savings in exchange for a commitment to use EC2 capacity over a set term, with the 3-year term providing the highest savings compared to the 1-year option. AWS does not offer a 5-year term for Reserved Instances, so 3 years is the longest available and the most cost-effective option.

Summary: A 3-year Reserved Instance term provides the greatest cost savings, making option C the correct answer.

A company runs Amazon EC2 instances in a research lab. The instances run for 3 hours each week and cannot be interrupted.

What is the MOST cost-effective instance purchasing option to meet these requirements?

- A. Compute Savings Plan
- B. On-Demand Instances **Most Voted**
- C. Convertible Reserved Instances
- D. Spot Instances

Correct Answer: B

Community vote distribution

B (73%)

A (18%)

9%

Comments

Yak_Yeti 1 year, 6 months ago

Selected Answer: B

The most cost-effective instance purchasing option for this scenario is B. On-Demand Instances. Here's why:

On-Demand Instances are ideal for workloads that run for short durations and cannot be interrupted. They provide the flexibility to pay for compute capacity by the hour or second, with no long-term commitments.

Compute Savings Plans and Convertible Reserved Instances are more cost-effective for longer-term, consistent usage but require a commitment over a 1 or 3-year term.

Spot Instances offer the lowest prices but can be interrupted by AWS with little notice, making them unsuitable for workloads that cannot be interrupted.

upvoted 4 times

ShaiTay 1 year, 7 months ago

upvoted 2 times

Marley 1 year, 11 months ago

Selected Answer: A

The question is "MOST cost-effective" which is compute savings plan

upvoted 1 times

DandyAndy 1 year, 12 months ago

Selected Answer: B

Per ChatGPT

Compute Savings Plans are not suitable for instances that run for only 3 hours a week without interruption. Compute Savings Plans provide discount for consistent usage of EC2 instances in exchange for a commitment to a specific amount of compute usage (measured in dollars per hour) over a 1- or 3-year term. They are designed for workloads with predictable and sustained usage, not for sporadic or short-duration instances like those running only 3 hours per week. Therefore, Compute Savings Plans would not be the most cost-effective option for this scenario.

upvoted 4 times

kimbi 2 years ago

Selected Answer: A

The correct answer is: A. Compute Savings Plan

Since the instances run for a fixed 3 hours each week and cannot be interrupted, a Compute Savings Plan is the most cost-effective option. This plan provides a discount on EC2 instances usage based on a committed hourly usage over a 1-year term, which aligns with the company's predictable usage pattern.

On-Demand Instances: This option would charge the company the full hourly rate for the instances, without any discounts

A new AWS user needs to interact with AWS Support by using API calls.

Which AWS Support plan will meet this requirement MOST cost-effectively?

- A. AWS Basic Support
- B. AWS Developer Support
- C. AWS Business Support **Most Voted**
- D. AWS Enterprise Support

Correct Answer: C

Community vote distribution

Comments

Dacusai **Highly Voted** 2 years ago

Answer C is correct.

According to AWS Developer support doesn't support API calls, Business, Ent on Ramp and EMT does,

<https://aws.amazon.com/premiumsupport/plans/>

upvoted 13 times

dragossky **Most Recent** 5 months ago

Selected Answer: B

Answer: B. AWS Developer Support

Explanation:

To interact with AWS Support via API (Support API/Trusted Advisor API), you need a paid support plan. The most cost-effective paid tier that includes programmatic access to AWS Support is Developer Support.

Why not the others:

A. Basic Support: Free, but does not include Support API access.

C. Business Support and D. Enterprise Support: Both include Support API access, but they are more expensive than Developer Support. If your only requirement is API access, Developer is the most cost-effective choice.

<https://www.scaler.com/topics/aws/aws-support-plans/>

upvoted 1 times

Ty13 1 year, 3 months ago

Selected Answer: C

Developer Support DOES NOT allow you to interact with AWS Support using API calls. The Developer plan provides access to AWS Support through email only.

upvoted 1 times

2682f50 1 year, 3 months ago

Selected Answer: B

The key point of the question is "most cost-effective."

Developer Support (B) costs only \$29/month and provides API access to AWS Support, making it the cheapest option. Business Support (C) costs at least \$100/month—while it offers faster response times, it incurs additional costs just for API access.

Both plans support API access, but Developer Support is more affordable.

If API access is the only requirement, there is no need to choose a more expensive plan. Business Support is suitable for enterprises that need 24/7 support and faster response times, but that is not what the question is asking for in terms of the "most cost-effective" option
upvoted 1 times

Rawanj_10 1 year, 5 months ago

Selected Answer: C

In addition, customers with a Business, Enterprise On-Ramp, or Enterprise Support plan have access to these features:

Use-case guidance – What AWS products, features, and services to use to best support your specific needs.

AWS Trusted Advisor – A feature of AWS Support, which inspects customer environments and identifies opportunities to save money, close security gaps, and improve system reliability and performance. You can access all Trusted Advisor checks.

The AWS Support API to interact with Support Center and Trusted Advisor. You can use the AWS Support API to automate support case management and Trusted Advisor operations.

C. AWS Trusted Advisor with AWS Business Support
Here's why:

AWS Trusted Advisor is a service that inspects your AWS environment and provides recommendations for optimizing various aspects of your AWS resources, including cost optimization, security, fault tolerance, and performance. It also checks service limits and usage metrics.

AWS Business Support (Option C) includes full access to AWS Trusted Advisor, as well as other benefits like unlimited case submissions, guidance from cloud support associates, and access to infrastructure event management.

upvoted 1 times

red_panda 2 years, 1 month ago

The correct answer is A because you are going to pay Trusted Advisor separately; so for cost optimization you can use the developer support
upvoted 1 times

CTao 2 years, 1 month ago

Selected Answer: C

Correct answer is C. AWS Developer Support is a lower-tier support plan that does not include access to AWS Trusted Advisor.

C. AWS Migration Hub - AWS service designed to help users plan, track, and manage their server and application inventory during the migration process to AWS.

upvoted 1 times

chalaka 1 year, 9 months ago

Selected Answer: C

C. AWS Migration Hub : helps users plan, track, and manage the migration of their server and application inventory to AWS. It provides a single place to monitor and track the progress of migrations across various AWS and partner migration tools.

upvoted 1 times

seif1993 1 year, 10 months ago

Selected Answer: C

C. AWS Migration Hub

Explanation: AWS Migration Hub helps users plan and track their server and application inventory migration data to AWS. It provides a single location to monitor the progress of application migrations across multiple AWS and partner solutions. Migration Hub offers visibility into the status of each migration and helps in tracking and planning the migration process effectively.

upvoted 2 times

tsix 1 year, 10 months ago

Selected Answer: D

D is the answer.

AWS Application Migration Service focuses on automating and executing the actual migration of servers and applications to AWS.

AWS Migration Hub acts as a centralized dashboard for tracking and managing the migration process, offering visibility across various migration tools but not performing the migrations itself.

Comments

Jesswhj **Highly Voted** 1 year, 11 months ago

Selected Answer: B

B. Governance

Data curation – Collect, organize, access, and enrich metadata and use it to organize an inventory of data products in a Data Catalog. A Data Catalog can help facilitate data monetization and self-service analytics by helping data consumers quickly locate relevant data products as well as understand their context, such as provenance and quality.

upvoted 7 times

Oohmyhanna **Most Recent** 11 months, 3 weeks ago

Selected Answer: D

The Platform perspective in the AWS Cloud Adoption Framework (CAF) focuses on:

Organizing technical resources like data products

Cataloging services and systems

Managing tools such as AWS Glue Data Catalog, databases, APIs, etc.

upvoted 1 times

MeLikeChoco 1 year, 6 months ago

Selected Answer: B

It's B.

It's the very first line of governance perspective's data curation:

<https://docs.aws.amazon.com/whitepapers/latest/aws-caf-governance-perspective/data-curation.html>

upvoted 3 times

d00b229 1 year, 9 months ago

C. Business

upvoted 1 times

2dd0f97 1 year, 11 months ago

It's C

The Business perspective within AWS CAF focuses on defining the business outcomes, setting up business requirements, and managing business risk associated with cloud adoption. Organizing an inventory of data products in a data catalog aligns with the business goals of understanding and managing data assets effectively, ensuring they contribute to business value and objectives. Therefore, the Business perspective is the correct answer in this context.

Selected Answer: C

S3 Standard IA - Storage Cost: $\$0.0125 \times 100 = \$1.25/\text{month}$
S3 Glacier Flexible Retrieval: Storage Cost: $\$0.004 \times 100 = \$0.40/\text{month}$

While S3 Glacier Instant Retrieval might also be considered, S3 Standard-IA is likely more cost-effective for 5 MB files that may be accessed occasionally, as Glacier Instant Retrieval has a minimum storage duration of 90 days

Selected Answer: B

B. S3 Standard-Infrequent Access (S3 Standard-IA) - Best suited for data that is rarely accessed, but needs to be retrieved immediately when needed.
