The answer is A. AWS Artifact.

AWS Artifact is your go-to resource for on-demand access to AWS compliance reports, including SOC reports, PCI DSS attestations, and ISO certifications. It provides a central repository where you can download these documents for review.

Here's why the other options are not the correct choice:

* AWS Concierge Support & AWS Support: These are support channels for getting help with AWS services. While they might be able to point you to where the reports are located, they don't directly provide the reports themselves. Artifact is the self-service portal for this.

* AWS Trusted Advisor: Trusted Advisor provides recommendations for optimizing your AWS environment for cost optimization, performance, security, and operational excellence. It doesn't provide compliance reports like SOC reports.

AWS Compute Optimizer is a service that analyzes your AWS resources' configuration and utilization metrics to provide you with rightsizing recommendations. It reports whether your resources are optimal, and generates optimization recommendations to reduce the cost and improve the performance of your workloads. Compute Optimizer also provides graphs showing recent utilization metric history data, as well as projected utilization for recommendations, which you can use to evaluate which recommendation provides the best price-performance trade-off. The analysis and visualization of your usage patterns can help you decide when to move or resize your running resources, and still meet your performance and capacity requirements.

There is no time specified, so you cannot assume that the application will have to run for a year, which makes an on-demand more logical.

- On-demand: Like a resort where you come and pay full price whenever you like.
- Reserved: You plan ahead and commit to staying for one to three years, receiving a discount.
- Savings plan: You commit to spending a specific amount monthly, allowing flexibility in room types.
- Spot instances: Last-minute discounts for empty rooms, but you can be asked to leave if someone pays more.
- Dedicated host: You book the entire resort building, having your own hardware.

Capacity reservation: You book a room without certainty of staying, paying full price regardless.

A is more about cost efficiency. Also serverless has some limitations like size of request has to be very small, max number of requests per second (throttling) - so balancing performance for cost- so A doesn't seem like it.

Design Principles

- Democratize advanced technologies - Advance technologies become services and hence you can focus more on product development

- Go global in minutes - Easy deployment in multiple regions

- Use serverless architectures - Avoid burden of managing servers

- Experiment more often - Easy to carry out comparative testing

- Mechanical sympathy - Be aware of all AWS services

Both A & B are correct answers. Leaning more towards A since Scaling horizontally (Option B) is also crucial but is more about handling increased load efficiently rather than optimizing resource usage per se. Both are important, but serverless architectures can offer more direct benefits in terms

of performance efficiency by automatically managing resource allocation.

According <https://aws.amazon.com/blogs/apn/the-6-pillars-of-the-aws-well-architected-framework> correct answer is A because:

There are five design principles for performance efficiency in the cloud:

- Democratize advanced technologies
- Go global in minutes
- Use serverless architectures
- Experiment more often
- Consider mechanical sympathy

AND

Scale horizontally to increase aggregate workload availability - is part of the principles for reliability in the cloud.

Horizontal scaling ensures performance by adding more resources, such as EC2 instances or containers, as needed to handle increased traffic or workload demands. My answer is C.

The reason not D because AWS Professional Services is a team of AWS experts focused on helping customers design, architect, and deploy solutions. They can provide strategic planning assistance before the launch, such as architecture design, migration planning, or launch strategy. However, AWS Professional Services primarily focuses on consulting and project-based work. It does not directly provide infrastructure event management or 24/7 real-time support during the launch. Those capabilities are typically offered through AWS support plans like Enterprise Support. Therefore, this option meets the pre-launch requirement but not the during-launch need for real-time support.

Reserved instances: • Up to 75% discount compared to On-demand on hourly rate 1 or 3 years commitment

• All upfront, partial upfront, no upfront

upvoted 1 times

Selected Answer: AE

A. Standard Reserved Instance:

Standard Reserved Instances (RIs) are ideal for workloads that run 24/7 and are predictable over a long period (e.g., 12 months). By committing to a specific instance family and type, the company can get significant discounts compared to On-Demand pricing.

E. All Upfront payment:

Choosing the All Upfront payment option for Reserved Instances provides the maximum discount. This option allows the company to pay for the entire 12-month commitment upfront, further reducing costs compared to monthly payments or partial upfront payments.

For the most cost-effective combination of purchasing options for an uninterruptible Amazon EC2 workload running continuously with the same instance family and type for the next 12 months, you should choose:

Selected Answer: A

To meet the company's need to monitor the ongoing costs of the e-commerce website and keep expenses within a specific budget, the most suitable AWS service is AWS Cost Explorer. Cost Explorer provides detailed cost analysis, budget monitoring, and forecasting capabilities, allowing the company to track the website's operational costs (e.g., S3 storage for product images, EC2 compute costs) and ensure they don't exceed the budget.

Final Answer: A. AWS Cost Explorer.

You don't need to manage any infrastructure, and you only pay for the time your code is running.

It allows you to run AWS infrastructure in your own data center while still managing it like you would in the cloud. So, you get the benefits of AWS services, but the hardware stays at your location.
